

## Corporate Enterprise Firewall Settings

ThoughtOffice taps into several primary web-specific databases to provide you up-to-the-minute content in your creativity searches. In some situations, the firewall settings on a given corporate server will halt the flow of information back to ThoughtOffice, making the program "error-out".

In order to ensure you achieve maximum performance with this program, please have your IT person accomplish the following:

- 1) Ensure you're on a good Web connection.
- 2) If you're behind a corporate secure firewall, you need to have your IT person specify that the following info is "Whitelisted" at the security software:

- Domain: gadgetplugins.com
- IP Address: 66.235.192.239
- Web server Address: www.gadgetplugins.com

Your IT person should know how to acquire IP Addresses for the following as well:

- thoughtoffice.gadgetplugins.com
- www.onelook.com
- www.rhymezone.com
- search.lyrics.astraweb.com
- scriptures.lds.org
- www.quotationspage.com
- inventory.overture.com
- www.veer.com

- 3) Install ThoughtOffice on your Mac OSX or Windows XP computers.
- 4) Launch ThoughtOffice.
- 5) For each install, have the user locate and set the Modules folder in Preferences.
- 6) Start or load a Session and begin your brainstorming!
